### PHARMACOLOGICAL STUDY OF COMPOUNDS OF THE INVENTION

**EXAMPLE 43** : *In vitro* activity

✧ L1210 murine leukaemia

20 L1210 murine leukaemia was used *in vitro*. The cells are cultured in RPMI 1640 complete  
culture medium containing 10 % foetal calf serum, 2mM glutamine, 50 units/ml of

penicillin, 50 µg/ml of streptomycin and 10mM Hepes, pH = 7.4. The cells are distributed on microplates and are exposed to the cytotoxic compounds for 4 doubling periods, or 48 hours. The number of viable cells is then quantified by a colorimetric assay, the Microculture Tetrazolium Assay (J. Carmichael *et al.*, Cancer Res.; 47, 939-942 (1987)).

5 The results are expressed as the IC<sub>50</sub>, the concentration of cytotoxic agent which inhibits the treated cells by 50 %. All the compounds of the invention exhibit good cytotoxicity with respect to this cell line. By way of example, the compound of Example 20 has an IC<sub>50</sub> of 0.074µM with respect to L1210.

✧ Human cell lines

10 The compounds of the invention were also tested on human cell lines originating from solid tumours, in accordance with the same test protocol as that described for L1210 murine leukaemia but with incubation periods of 4 days instead of 2 days. By way of illustration, the compound of Example 20 has an IC<sub>50</sub> of 190nM with respect to DU145 prostate carcinoma and of the order of from 10 to 200nM with respect to human lines  
15 originating from A549 non-small-cell lung carcinoma, HT-29 colon carcinoma and KB-3-1 epidermoid carcinoma.

**EXAMPLE 44 : Action on the cell cycle**

L1210 cells are incubated for 21 hours at 37°C in the presence of various concentrations of test compounds. The cells are then fixed by 70 % (v/v) ethanol, washed twice in PBS and  
20 incubated for 30 minutes at 20°C in PBS that contains 100 µg/ml of RNase and 50 µg/ml of propidium iodide. The results are expressed in terms of the percentage of the cells that accumulate in the G2+M phase after 21 hours, compared with the control (control: 20 %). The compounds of the invention are especially interesting, at a concentration of less than 2.5µM causing accumulation of at least 70 % of cells in the G2+M phase after 21 hours.

**EXAMPLE 45 : *In vivo* activity*****Anti-tumour activity on P 388 leukaemia***

Line P388 (murine leukaemia) was supplied by the National Cancer Institute (Frederick, USA). The tumour cells ( $10^6$  cells) were inoculated on day 0 into the peritoneal cavity of female B6D2F1 mice (Iffa Credo, France). Six mice weighing from 18 to 20 g were used in each test group. The products were administered by the intraperitoneal route on day 1.

The anti-tumour activity is expressed as % T/C :

$$\% \text{ T/C (mouse)} = \frac{\text{Median survival time of the treated animals}}{\text{Median survival time of the control animals}} \times 100$$

The results obtained show excellent *in vivo* activity in the P 388 leukaemia model, with a T/C of 210 % for a dose of 50 mg/kg, along with low toxicity of the compounds, indicating an excellent therapeutic index.
